Learning theories suggest that learning through experience is very important in shaping criminal behaviour. Therefore, they are a nurture theory

## Albert Bandura's Social Learning Theory

Social Learning Theory proposes that we learn all of our behaviour from others. This theory can be used to explain all kinds of behaviour, including criminal behaviour.

### Banduras Bobo Doll Experiment

**BANDURA (1961)** CONDUCTED A CONTROVERSIAL EXPERIMENT EXAMINING THE PROCESS BY WHICH NEW FORMS OF BEHAVIOUR – AND IN PARTICULAR, AGGRESSION – ARE LEARNT. THE INITIAL STUDY, ALONG WITH BANDURA'S FOLLOW-UP RESEARCH, WOULD LATER BE KNOWN AS THE BOBO DOLL EXPERIMENT. THE EXPERIMENT REVEALED THAT CHILDREN IMITATE THE AGGRESSIVE BEHAVIOUR OF ADULTS. THE FINDINGS SUPPORT BANDURA'S SOCIAL LEARNING THEORY, WHICH EMPHASISES THE INFLUENCE OF OBSERVATIONAL LEARNING ON BEHAVIOUR.

BANDURA ALSO CONDUCTED A NUMBER OF FOLLOW-UP STUDIES DURING THE 1960s WHICH EXAMINED HOW WITNESSING A THIRD PARTY BEING REWARDED OR PUNISHED FOR BEHAVING IN A PARTICULAR MANNER CAN INFLUENCE A BYSTANDER'S OWN ACTIONS. HE CONCLUDED THAT VICARIOUS LEARNING, AS WELL AS DIRECT REWARDS AND PUNISHMENTS, CAN IMPACT ON AN OBSERVER'S BEHAVIOUR.

## Social Learning Theory and Criminal Behaviour

### Role Models.

Bandura invented the term role model to describe individuals who people will imitate; this is particularly true of children. Children seem to actively seek out people to copy. Role models are people that we look up to and respect, such as parents, older siblings, peers, and people and characters we see in the media.

### Vicarious Learning

This is a type of learning that occurs when a person sees another rewarded for their behaviour. Vicarious means literally experiences through others. The important thing is that the reward is experienced by the person whose behaviour is being imitated.

A YOUNG GIRL MIGHT IDENTIFY WITH HER OLDER SISTER, WHO IS IN A GROUP OF FRIENDS WHO GET INTO TROUBLE, SECONDLY, A TEENAGE BOY MAY IDENTIFY WITH A GANGSTER CHARACTER FROM HIS FAVOURITE FILM.

**ACTIVITY 1:** Use the following terms to explain how social learning theory would explain why the boy and girl end up involved in deviant and/or criminal behaviour.

- Observational learning
- Role Models
- Vicarious Learning (rewards)
- Imitation (copying)

## SOCIAL LEARNING THEORY (EVALUATION)

### STRENGTHS OF SOCIAL LEARNING THEORY

The BoBo doll experiment showed the role models have an effect on the child's, the model's behaviour was copied or imitated, often very closely. Children were likely to imitate the behaviour of role models, even if that behaviour was wrong.

The experiment allowed researchers to control important variables, such as the gender and actions of the model, were controlled for, thus allowing greater accuracy. The study has been

### LIMITATIONS OF SOCIAL LEARNING THEORY

The theory does not account for people who turn to crime, even though they have not been exposed to criminal role models. In these cases, criminal behaviour may be better explained by innate factors (nature) such as genes or brain abnormalities.

Page 2

## Psychodynamic Theory

Psychodynamic theory was developed in the 19th century by Sigmund Freud. Freud was one of the first people to point out that early childhood experiences were important in shaping the adult personality. For Freud the roots on all adult problems could be found in childhood.

### The Importance of the Unconscious Mind

Freud developed a model of the human mind as being like an iceberg, with most of it hidden beneath the surface.

### The Tripartite Structure of Personality

Freud described three parts to human personality - the **id**, the **ego**, and the **superego**.

### The Tripartite Structure of Personality

- **Id** – (DEVIL) FIRST PART TO DEVELOP – SELFISH/IMPULSIVE – LIVES IN THE **UNCONSCIOUS**
- **Superego** (ANGEL) – DEVELOPS WHEN WE INTERNALISE PARENTS' RULES – MORALISTIC PART OF THE MIND/ PERFECTIONIST – ALSO FOUND IN **UNCONSCIOUS**
- **Ego** (REFEREE) – REALISTIC PART OF THE MIND – BALANCES THE DEMANDS OF SUPEREGO AND ID – LARGELY **CONSCIOUS**

## The Link With Criminality

- ALL OF THESE COMPONENTS OF PERSONALITY HAVE AN IMPACT CRIMINALITY.
- A PERSON WHO IS **ID DOMINANT** WILL BE ANTISOCIAL, THEY MAY WELL BE BOTH **PHYSICALLY** AND **SEXUALLY** AGGRESSIVE.
- **EGO DOMINANT** TYPES MIGHT FOLLOW THE RULES BUT THAT DOESN'T MEAN THEIR BEHAVIOR WILL BE 'MORAL'. THIS TYPE MIGHT COMMIT **STATE CRIMES** BECAUSE THEY ARE NOT BREAKING ANY RULES BY TAKING PART.
- AN UNDER-DEVELOPED **SUPEREGO** IS ALSO LINKED TO CRIME. **SOCIOPATHS** ARE PEOPLE WHO HAVE A VERY WEAKLY DEVELOPED CONSCIENCE, SOMETIMES THEY HAVE NO CONSCIENCE AT ALL.

### A Healthy Personality Is a Balanced Personality

All of these components of personality have an impact criminality. A person who is **id** dominant will be antisocial, they may well be both physically and sexually aggressive. **Ego** dominant types might follow the rules but that doesn't mean their behaviour will be 'moral'. For example, a person with this type of personality might commit state crimes because they are not breaking any rules by taking part in them. An under-developed **superego** is also linked to crime. Sociopaths are people who have a very weakly.

**ACTIVITY 2:** Explain what is meant by the following.

## FREUD THEORY (EVALUATION)

### STRENGTHS OF PSCHODYNAMIC THEORY

Psychodynamic theories have contributed to research about crime and behaviour. In particular, the focus on childhood experiences and the importance of them on future behaviour should be regarded as very important in many modern theories of criminality.

### LIMITATIONS OF PSCHODYNAMIC THEORY

Freud's theories are very difficult to investigate. Concepts such as the unconscious are almost impossible to research scientifically which is regarded as important by most modern criminologists.

Fr

## JOHN BOWLBY & THE MATERNAL DEPRIVATION HYPOTHESIS

John Bowlby was a psychologist who was heavily influenced by Freud. In the 1940's Bowlby outlined the maternal deprivation hypothesis; this was the idea that frequent or prolonged disruptions to the child's primary attachment relationships would have serious consequences for the later development of the child and on into adulthood.

## THE 44 JUVENILE THIEVES STUDY, BOWLBY (1944)

JOHN BOWLBY (1944) SUPPORTED HIS CLAIMS WITH HIS OWN INVESTIGATION OF 44 JUVENILE THIEVES. HE FOUND, THROUGH INTERVIEWS WITH THE THIEVES AND THEIR FAMILIES, THAT 14 OF THE SAMPLE HE STUDIED SHOWED PERSONALITY AND BEHAVIOURAL CHARACTERISTICS THAT COULD BE CLASSIFIED AS 'AFFECTIONLESS PSYCHOPATHY'. OF THESE 14, 12 HAD EXPERIENCED PROLONGED SEPARATION FROM THEIR MOTHERS DURING INFANCY (IN PARTICULAR, THE FIRST TWO YEARS OF THEIR LIVES). IN A NON-CRIMINAL GROUP, ONLY TWO HAD EXPERIENCED SIMILAR EARLY SEPARATION. BOWLBY CONCLUDED THAT THE EFFECTS OF MATERNAL DEPRIVATION HAD CAUSED AFFECTIONLESS AND DELINQUENT BEHAVIOUR AMONG THE JUVENILE THIEVES.

## Consequences of Failure to Form Attachments Bonds in Childhood

- An inability to form attachments in the future
- Affectionless psychopathy (inability to feel remorse)
- Delinquency (behavioural problems in adolescence)
- Problems with Cognitive (Intellectual) Development

**Activity 3:** Research the term affectionless psychopathy? – What did Bowlby mean by this and what did he think was the cause of this condition

This image shows a full page of white paper with horizontal blue or grey ruling lines. The lines are evenly spaced and run across the width of the page, providing a template for handwriting practice. There are no margins, text, or other markings on the page.

## MATERNAL DEPRIVATION (EVALUATION)

## STRENGTHS OF MATERNAL DEPRIVATION THEORY

Bowlby's original research remains one of the most important sources of support for the maternal deprivation hypothesis. This was a rigorous, in depth study and benefited from the inclusion of a control group (a group of boys attending the Tavistock clinic for emotional problems) Bowlby concluded that the effects of maternal deprivation had caused affectionless and delinquent behaviour among the juvenile thieves.

Bowlby drew the conclusion from his research that the findings had implications for prevention of delinquency. Treatment of emotional problems in young delinquents is slow and difficult, so he suggested that it is preferable to try to prevent the problem in the first place by meeting

## LIMITATIONS OF MATERNAL DEPRIVATION THEORY

by's research has been criticised, he conducted the the research with the thieves himself and some people have suggested he may have biased the interview. Also, other factors might explain the results. It could be that problems in the mothers relationships caused the separations between mother and child and also caused the affectionless nature of some of the children. It could even be that the affectionless character caused the separations in some cases, e.g. a difficult child might be more likely to be placed in care.

ies which looked at children and later offending have not provided much support for the maternal deprivation hypothesis. **David Farrington** (2009) carried out a 40-year longitudinal study in the UK, beginning in the 1950s with

# PERSONALITY THEORIES

## Eysenck's Personality Theory

Eysenck believed that certain personality types are more likely to commit crime. This is because they crave excitement and are slow to learn that crime has negative consequences. He based his theory on the results of surveys carried out on 700 soldiers, who were being treated for various disorders at the Maudsley Hospital in London, shortly after the second world war.

From the soldiers' responses, Eysenck was able to identify 3 main personality traits, these were: **introversion-extroversion (E)**, **neuroticism-stability (N)** and **psychoticism-normality (P)**

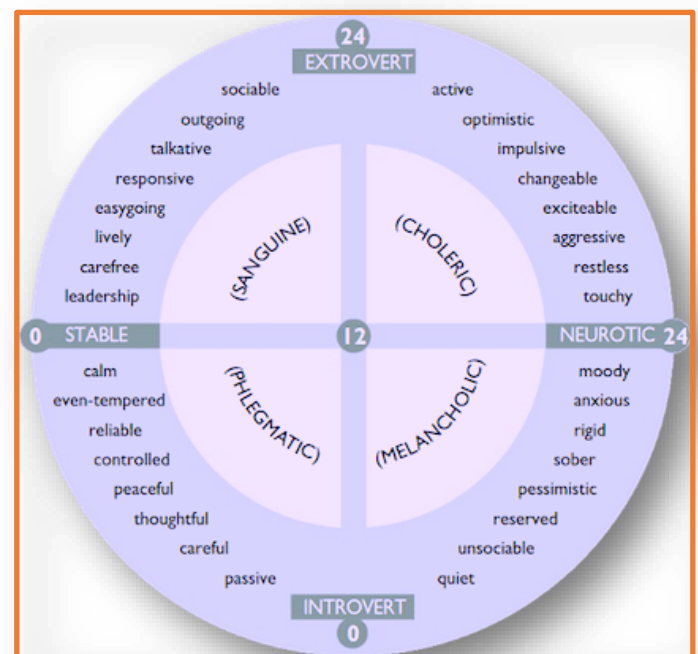

- **Extraversion-Introversion** - extroverts are characterised as outgoing, having positive emotions, but may get bored easily.
- **Neuroticism-Stability** - neuroticism is the tendency to experience negative emotional states (such as anger, anxiety and depression) rather than positive emotional states.
- **Psychoticism-Normality** - psychotics are egocentric, aggressive, impulsive, impersonal, lacking in empathy and generally not concerned about the welfare of other people.

## PERSONALITY AND BEHAVIOUR

The first of these traits, extraversion, refers to how socially oriented we are – some people need the company of others in nearly all situations, these people are extroverts, while others are happier with their own company introverts; most of us are somewhere in between the two extremes. The second of these traits is neuroticism, that is the degree to which we experience negative emotions such as anxiety, depression, or anger.

A high score might be indicative of someone who frequently experiences some or all of these negative emotions, people with low N scores are described as stable.

Eysenck thought all psychologically healthy people could be placed somewhere on the **extraversion-introversion** and the **stability-neuroticism** scales, some people will score at the extremes, but this does not make them abnormal or unhealthy. **Psychoticism** on the other hand refers to character traits that would make us cold, uncaring, and unfeeling. Eysenck thought that this trait would not be found in healthy people and that people who scored high on this trait were potentially criminal.

## THE RELATIONSHIP OF PERSONALITY TO CRIMINALITY

- Eysenck believed that high **E scorers**, when coupled with a high **N score** could under some circumstance be more likely to commit crime.
- A high **P score** would invariably be associated with crime as these individuals do not have the social tools to fully function in society.
- **Psychoticism** has been related to higher levels of **testosterone**, which means that men (who have higher levels of testosterone than women) are more likely to be found at this end of the spectrum.

### STRENGTHS OF EYSENCK'S THEORY

The Eysenck Personality

Inventory (The EPI) has research which suggests it is a valid (accurate) test. For example, Dunlop et al. (2012) found that both extraversion and psychoticism, as well as lie scales, were good predictors of delinquency.

### LIMITATIONS OF EYSENCK'S THEORY

The

EPI is a 'self-report' measure and as such is subject to some of the disadvantages of this method. People can give deliberately false answers or the answer that they think the researcher want (social desirability). This makes the test less valid.

## PERSONALITY THEORIES (EVALUATION)

**ACTIVITY 4:** Explain in your own words how personality is thought to be related to criminal behaviour – include the following words – extraversion/neuroticism; neuroticism/stability and psychoticism/normality. Your answer should cover Eysenck's theory of personality and his research.
